

## Czech Republic: December inflation good news for the central bank

December inflation brought a downward surprise and is good news for the central bank. However, the main issue at the moment is the January re-pricing and the impact of government measures on the CPI. The January number should bring inflation back to higher levels, but lower than the central bank expects

The food and non-alcoholic beverages section saw the most significant negative contribution to Czech annual inflation in June

# 15.8%

December inflation (YoY)

Lower than expected

### Mixed picture but overall lower than expected

The overall level of consumer prices remained the same in December as in November (0.0% month-on-month). On an annual basis, consumer prices rose by 15.8% in December, 0.4pp lower than in November. The average inflation rate for the full year 2022 was 15.1%. Price developments

varied across the different sections of the consumer basket. The fall in fuel prices was offset by price increases, particularly in housing, energy and food. However, growth in these items was lower than we expected.

Core inflation also slowed from 0.4% to 0.2% MoM according to our calculations which translates into a slowdown from 13.8% to 13.2% year-on-year. The official number will be published by the Czech National Bank (CNB) later today but the overall picture is positive for the central bank. The CNB's November forecast was expecting a 19.1% headline number for December, however if we adjust this number for the effect of government measures, today's result is close to the CNB's forecast.

## Contributions to year-on-year inflation (pp)

## Re-pricing is the main risk for January

December brought a significant signal that inflation is coming under control. However, the true test of where inflation really is will not come until January. For the next figure, we see two main issues: energy prices and new year repricing. From January, the government's measure will switch from a saving tariff to an energy price cap, but we estimate this should have about the same effect (3.5pp). We thus see the main uncertainty in the January re-pricing. On the regulated side, apart from energy prices, we see a 5% excise tax hike on tobacco, which should lead to a 0.1pp contribution to CPI.

On the market side, the situation is unclear. Last January, prices jumped by 4.4% MoM, the most in the region. The same pace would equal 15.7% YoY this year. We don't have all the surveys yet, but it is already certain that the same drop in fuel prices as in December (10% MoM) cannot be expected for January. And it can also be assumed that January is the last time retailers can increase their margins and offset higher costs. On the other hand, today's number lowers our expected inflation profile from above 17% to above 16% for January.

## Central bank expectations

For CNB, today's number is clearly good news. Given the underestimated effect of government measures on the CPI, it's hard to read where the central bank's expectations really are these days. However, Governor Ales Michl mentioned in a recent interview that inflation may reach levels above 20% YoY in January. However, yesterday Deputy Governor Eva Zamrazilova said she expects levels more around 18% YoY. Both estimates suggest that the CNB expects the YoY figure to return

to higher levels after the end of the saving tariff. The central bank will release a new forecast before the January number, however, at the moment we expect January inflation to be below the central bank's expectations. On the other hand, we believe the rhetoric of "higher rates for longer" will remain in place.
