

# EUR & ECB crib sheet: A half-point hike is not good news for the euro

We expect the European Central Bank (ECB) to hike by 50bp at its September meeting. Markets are pricing in 66bp at the moment, and the consensus is leaning in favour of 75bp, so we see some downside risks for the euro. At the same time, short-term rates have not had much of an impact on EUR/USD lately, and the energy crisis should remain the key driver

## Four scenarios ahead of the September ECB meeting

As discussed in our [September ECB preview](#), policymakers in Frankfurt will likely have to choose between a 50bp or 75bp rate hike this week. We think that a 75bp move would be too hard to digest for the dovish front within the Governing Council, and our call is for a 50bp move. That said, we cannot fully exclude a 75bp hike aimed at frontloading tightening before a recession hits this winter.

In our “Crib Sheet”, we analyse four potential scenarios on a scale from dovish to ultra-hawkish and what this can mean for EUR/USD and EUR rates, taking into account the size of the rate hike as well as the ECB’s stance on inflation, growth and quantitative easing/tightening (QE/QT).

## EUR and ECB crib sheet

Scenario analysis: How to position for Lagarde's alternatives

	Inflation outlook	Growth outlook	Interest rates	Quantitative easing	EUR/USD (0.99)	10Y Bund (1.63%)
Current stance	Inflation to stay undesirably high for some time, but to ease further ahead	Some factors are significantly clouding the outlook for 2H22	Depo at 0.00%. Future rate path will be data-dependent	APP and PEPP in reinvestment phase. TPI can be triggered but has conditionality		
Dovish	Upside risks in near term, but medium-term infl. may return to target	Staff projections see a sharp drop in GDP from winter and into 2023.	<b>25bp hike.</b> Worsening outlook suggests slower pace of tightening	Increased probability of activating TPI	0.96	1.50%
<b>ING Base Case (moderately dovish)</b>	Infl. to stay high, ease ahead thanks to less supply strains and hikes	Projections show recession around winter	<b>50bp hike.</b> Maintaining a fully data-dependent approach	Unchanged	0.98	1.60%
Moderately hawkish	Inflation to remain elevated for longer than previously forecasted	Projections show negative growth only in 4Q22	<b>75bp hike.</b> Maintaining a fully data-dependent approach	Some hints that balance sheet reduction is being discussed	1.00	1.70%
Very hawkish	Inflation seen persistently above target in the projection period	Projections show no negative growth this year or in 2023	<b>75bp hike signalling 50bp or 75bp moves ahead, or a 100bp hike</b>	Balance sheet reduction will start in 2024	1.02	1.75%

## Downside risks for EUR...

The market's pricing for the meeting is currently around 66bp, which by itself suggests some negative reaction by the EUR if our 50bp call proves correct. Much of the market reaction will also be driven by any hints about future policy.

Since a reiteration of the meeting-by-meeting, data-dependent approach seems quite likely, markets will have to derive their rate path expectations from the updated staff projections on growth and inflation. In particular, the size and length of a winter recession will be key, and should it become the ECB's baseline scenario, then some dovish re-pricing across the curve might occur and weigh on the euro.

Comments about the euro weakness are likely to be a theme too and could have some impact on the EUR. However, verbal protest about a weak currency is now the norm among many central banks and has notably yielded very few results. Unless any reference to FX interventions is made, markets may not read too much into currency-related comments.

### ... but the ECB is a secondary driver now

Regardless of the direction of the EUR reaction on Thursday, there's a non-negligible chance that the FX impact will prove rather short-lived. This is because EUR/USD has been blatantly unreactive to ECB rate expectations lately, as the energy crisis has continued to drive the majority of the pair's moves. In the chart below, we show how the two-year EUR-USD swap rate differential – a gauge of ECB-Fed monetary policy divergence expectations – has moved significantly in favour of the EUR recently, but EUR/USD has failed to follow it higher.

### EUR/USD hasn't followed the short-term rate differential higher

Source: Refinitiv, ING

In our EUR/USD short-term fair value model, the short-term rate differential now has a smaller beta than relative equity performance, which is a gauge of diverging growth expectations and is more directly impacted by the energy crisis. This also means that the short-term undervaluation in EUR/USD has shrunk to around 3-4% from the 5-6% peak seen two weeks ago.

We expect the energy story to return firmly to the driving seat for EUR/USD after the post-

ECB reaction. Barring a very hawkish surprise, this should keep EUR/USD below parity and prevent it to reconnect with the more supportive rate differential. The 0.98-0.99 area could prove to be a near-term anchor for EUR/USD, but a further worsening of the energy crisis and/or further dollar strengthening can trigger a drop to the 0.96-0.97 area.
