

Weak inflation and strong growth underscore the Goldilocks US economy

The US economy continues to confound expects with US inflation getting close to target despite strong consumer growth. This spending is still being fuelled by savings and credit and surely can't continue running at these sorts of growth rates, but for now the consumer refuses to lie down. Fed rate cuts are coming, but March still looks too early

The US economy has been able to return inflation towards target in a strong consumer growth environment

Inflation on the cusp of hitting the 2% target

The December personal income and spending report contains a number of interesting stories, but the obvious headline is that the US economy has been able to return inflation towards target in an environment of vigorous consumer spending growth. Something that is even more remarkable after a significant supply shock and during a period of ultra-low unemployment.

There were no real surprises on the inflation front with the core personal consumer expenditure deflator (the Fed's favoured measure of inflation) coming in at 0.2% month-on-month, but the year-on-year rate is 2.9% rather than 3% – yesterday's GDP report basically told us this. Importantly, the MoM change was 0.17% MoM, which is exactly what we need to consistently

achieve to get inflation to 2% YoY over time. This is the sixth month in the last seven that we have been at or below this key threshold and this should give the Fed real confidence that the job is done on inflation and policy rates do not need to be so restrictive. In fact, the 3-month annualised rate is now just 1.5%, suggesting we run the risk of undershooting later this year!

Strong spending still driven by legacy savings

For activity to be so strong in this benign inflation environment is astonishing. Consumer spending rose 0.7% MoM versus the 0.5% consensus with an upward revision to November from 0.2% to 0.4% growth. Unfortunately, it isn't being fuelled by incomes, which rose only 0.3% MoM nominally while the true measure of spending power – real household disposable income – which is income after tax and adjusted for inflation, rose just 0.1% MoM. For real (inflation adjusted spending) to be up 0.5% MoM, it highlights how important the run-down of savings and robust credit card spending continue to be in keeping overall consumption so strong.

Real household disposable incomes remain lacklustre

First-quarter GDP growth set to remain robust, leaving May the more likely start point for rate cuts

This is not sustainable over the long term, but the consumer refuses to lie down. Given this momentum, first-quarter GDP looks increasingly likely to be in the 1.5-2% range, meaning the consensus of 0.6% growth needs to be revised up – even if there is zero consumer spending growth in January, February and March, the QoQ annualised rate of consumer spending growth will be 2.1% in the first quarter! This must make a March rate cut look less likely and we continue to favour May being the timing for the first move.
