Key events in developed markets next week

The Bank of England meeting will be in the limelight next week but we don't expect rates to enter negative territory for a while. We'll also be keeping an eye out on US fiscal stimulus talks and employment data and the myriad data releases coming out of the Eurozone

Source: Shutterstock

✓ Bank of England to pass on negative rates

Next week's Bank of England meeting will be coupled with new information on the Bank's review it has conducted on negative rates - in particular the impact on commercial banks. However, our impression is that concerns surrounding banking sector profitability/health are unlikely to be the factor that stops the Bank in its tracks. Instead, there is a certain amount of scepticism among some committee members on how useful the policy would be in practice - particularly now that the economic outlook is looking a little brighter.

So, while we could see the Bank formally lower its estimate of the lower bound to below zero next week, we don't expect policymakers to hint that negative rates are imminent.

We expect rates to remain on hold this year, while QE remains the primary tool of delivering stimulus.

US: Fiscal stimulus talks continue and the January employment report is released

In the US we will be looking to see how much progress can be made in negotiations over Joe Biden's proposed \$1.9tn stimulus plan.

Given wafer-thin Democrat majorities in the House and the Senate, President Biden's team will need to work with Republicans to get the legislation passed –the Senate filibuster where-by 60 Senators have to agree to end a debate and bring it to a vote is the toughest challenge. Consequently, it looks increasingly likely that there will be a dilution to get enough support and the package may need to be split in two with more contentious aspects delayed and incorporated into the budget reconciliation process, which only needs a simple majority to pass. Given the Donald Trump impeachment trial is scheduled for the week of 8 February, it looks increasingly likely that it will be late March before part of the package is signed into law. Moreover, it is likely to end up being closer to \$1tn than \$1.9tn.

In terms of the data, all eyes will be on the January employment report after December saw a 140,000 fall in jobs. We expect to see a modest positive figure given a decent start to the year based on high-frequency spending data, but there should be a better figure in February now that California stay at home order has been rescinded. This has allowed restaurants to re-open for outside dining and hair salons and nail bars to start accepting customers in the US' most populous state. However substantial improvements in employment are not going to happen until there is a broader re-opening of the economy, which could still be a few months away.

There will be several Federal Reserve officials speaking next week and they may face increasingly tough questioning over financial market conditions.

Eurozone: GDP, inflation and unemployment data

It'll be a big week for eurozone indicators with a ton of data being released.

Most important is the GDP release for 4Q, for which individual country estimates have already suggested that the negative impact from the second wave will be milder than initially expected. With surprisingly positive growth figures for Germany, Belgium and Spain and a milder than expected contraction for France, the eurozone aggregate is likely to have contracted by less than 1% in the fourth quarter.

Mind the inflation reading as well, which is set to jump on German VAT effects and higher energy prices across the zone. On Monday, we will also see Eurozone unemployment released for December. This will shed light on whether jobs are falling thanks to weakness in many sectors that are most impacted by the second wave of the coronavirus.

Key events in EMEA and Latam next week

It's a busy week of data releases with inflation, industry data, FX purchases and flash GDP, which should shed some light on the effects of the second wave. Also, the Czech National Bank is expected to maintain its policy stance for now

Source: Shutterstock

☑ Turkey: Inflation edging higher leaves possibility of further rate hikes

We expect January inflation (at 1.6% on monthly basis) to push the annual figure up slightly to 14.9% from 14.6%, continuing the uptrend of recent months. Elevated cost-push pressures, deteriorating expectations and relatively high trend inflation all add upside risk to the inflation outlook. Accordingly, there is a shift in the Central Bank of Turkey's focus to the medium term and it is more determined to keep a tight stance for longer, and leave the door open for more hikes depending on the inflation readings.

☑ Hungary: PMI to fall, but industry and retail data may provide some optimism

We see the Hungarian PMI dropping below 50 for the first time since September. Car manufacturers are facing supply chain issues due to the lack of computer chips, which is affecting production. Some producers have reduced working hours, others have closed factories for two

weeks. This should be reflected in the PMI, signalling a contraction in January. However, industrial production at least in year-on-year terms was able to improve in December, in our view. A year ago, there was a surprisingly strong drop, causing a low base. We expect the retail sector to finish 2020 with a relatively good reading, continuing its rebound from historic lows in spring last year.

Russia: FX purchases and inflation to increase

The Finance Ministry is likely to announce US\$1.5bn of FX purchases for February, up from January's US\$1.4bn, however this will not be a major concern for the local FX market as it will be a reflection of higher oil prices. The current account and its sterilisation through FX intervention is [unlikely to be an issue until 2H21](#), but this does not mean plain sailing for the ruble in the near-term given the volatility in emerging market risk appetite, and the Russia-specific capital account issues, including persistent foreign policy tension and shaky local confidence.

CPI statistics have recently become the source of bad news, and the data for January is unlikely to be an exception. Inflation is going to shoot up from December's 4.9% YoY to 5.3-5.5% YoY in January. For the most part, the spike should be treated as a [temporary](#) event, propelled by global agriculture inflation, recent ruble depreciation, and the low base effect of 1Q21. We stand by our expectations of a post-1Q21 reversal of CPI, and see no urgency for a key rate hike, especially given the moderation of economic recovery at the end of 2020, which will likely be confirmed by the preliminary GDP data for 2020. Nevertheless, the lack of demand-driven disinflation and upward pressure on households' CPI expectations (which may go up further in response to the government's highly-publicised attempts at arresting food price growth) is a concern, which will find its way into the Bank of Russia's monetary policy communication at the forthcoming board meeting on 12 February.

Czech Republic: CNB to stay on hold for now, and flash GDP data will show a decline

The Czech National Bank will stay on hold next week, but new forecasts should provide a more optimistic outlook for growth this year and it will likely maintain its tightening assumptions for the second half of this year, despite a faster appreciation of the koruna, which has delivered tighter conditions sooner than expected in the CNB's November forecast. We look for two hikes in 2H21. 4Q20 flash GDP data are due next week, and the Czech economy will decline again due to the second wave of the pandemic. Still, it should be less severe compared to the first wave, as industry did not shut down while retail and services fell less compared to the first spring wave.

Asia week ahead: Big policy week in India

India takes the spotlight next week with its FY21-22 budget and the central bank meeting shaping expectations of the economy's recovery. Sustained easier policies remain the order of the day, not just in India but elsewhere too

Source: Shutterstock

➔ India: Not the right time for policy reversal just yet

Next week, India unveils its FY21- FY22 budget on 1 February.

With close to 10% GDP contraction sharply denting revenue and record stimulus spending, the fiscal deficit is going to be through the roof in the current fiscal year (new fiscal year starts on 1 April). Our forecast for the deficit is 7.1% of GDP, which is twice the initial target of the government at 3.5% for the year (and up from 4.6% in the previous year). The risk to this forecast is tilted to the upside.

The government may strive for some fiscal consolidation without losing sight on the policy objective of supporting recovery.

This may call for some fiscal consolidation in FY21-22, of course without losing sight of the main policy objective of supporting recovery and, at the same time, boosting investor confidence and thus keeping sovereign downgrade risk at bay. It's a balancing act.

There has been news of possible hike on import duties, which aside from raising more revenue also serves the government's 'Make in India' drive. There may be some spending curbs in the pipeline too. We anticipate the deficit being programmed to fall below 6% of GDP. Yet, we don't think it's time for fiscal consolidation given that the headwind to the economy from Covid-19 pandemic is likely to remain strong.

The key question for the RBI meeting is whether the central bank see through the recent dip in inflation and leave policy on hold?

The Reserve Bank of India also meets on 5 February. The return of inflation to the RBI's 2-6% policy target zone in December, after a year of remaining above-target, could tip the central bank to resume its easing cycle. However, any such move could prove to be premature, especially as the inflation risk isn't yet fully eliminated.

The banking system remains flushed with liquidity, which is potentially inflationary. Nor do we think it's the right time to unwind policy accommodation just yet.

Rest of Asia: Data-packed calendar

China's official purchasing manager indices due over the weekend and the Caixin counterpart due out on early Monday will set the tone for Asian markets.

The January data may reflect some front-loading activity ahead of the Lunar New Year holiday in mid-February. Likewise, Korea's trade figures for January, which will be the first to provide a glimpse of regional exports coming into the new year. We see electronics remaining to be the main exports driver as the global semiconductor cycle is in the full swing.

The January data may bear out some front-loading of activity ahead of the Lunar New Year holiday in mid-February.

Among January CPI inflation data next week, Indonesia and the Philippines should stand out, given that inflation in both countries has started to tick up in recent months and likely remained on the upward path in January, closing the door on more rate cuts. Other countries to release CPI figures are Korea, Taiwan and Thailand and all are extremely low or close to negative inflation. Hong Kong

and Singapore also sit in this group as their retail sales data should show.

The Australian and Thai central bank are also due to meet next week and both are expected to stay on hold. The ultra-low policy rates at 0.10% and 0.5% respectively are here to stay throughout 2021.
