

Stuck in the middle with you

Inflation to the left of me! Bond yields to the right! So where exactly are we? Well, yes we're seeing higher prices. But we don't think this is a long-term worry. So, we're stuck in the middle. And that's exactly the focus of our latest Economic Update which we released on Thursday. Elsewhere, we've finally got a Libor transition date and a China growth target

Rates: Escape velocity

Ben Bernanke coined the phrase "escape velocity" in 2010, essentially saying that there needed to be plenty of oomph to growth, so the...

Source: Former Federal Reserve Chairman Ben Bernanke

The big driver here goes beyond reflation to an inflation spurt

It was only a month ago that the US 10-year threatened to break below 1%. Crucially it didn't, and indeed at the time, we noted that, if it did, it would not be down for long.

But since then, not only has it held above 1%, but that platform facilitated a leap to 1.5% in the space of just a few weeks. The tail end of that saw a 15 basis points rise in yield in intra-day trading in just a day (that's pretty big, by the way, if you're not a bond guru).

This certainly had the feeling of escape velocity. It coincided with a classic underperformance of the 5yr to the curve - the kind of thing you would look for to really class this a bear market for bonds.

And this move had nothing to do with supply pressure, by the way. It was and still is all about the build of a reflation theme. Moreover, it is a reflation theme with a very significant tint of an inflation spurt, one that may prove to be more persistent than many had thought possible.

Morphing the deflationary tail risk to one of inflation - we like that one

The Federal Reserve has, in a very persistent way, managed to morph the deflation tail risk into an inflation one - a risk they prefer to deal with. Moreover, aiming in that direction ticks other important boxes, such as growth and implied employment objectives. For bonds, though, this is a dangerous game, as inflation is a bond investor's worst enemy.

In fact, inflation is a significant risk for any security that pays the holder a set fixed amount with regularity into the future; inflation just eats away the value of that in real terms. Hence the rise in yields as compensation for higher inflation expectations. As we face a growth and inflation combination of at least 6% and 3%, respectively, it should be no surprise for us to be looking for 2% as the next big level to aim for on the US 10yr Treasury yield.

We have successfully escaped the deflationary pit of despair - staying comfortably above 1% keeps that at bay. Next stop is 2% to price in a 2% inflation environment on a zero real yield.

Even at that level, an implied zero real yield still does not feel like an equilibrium. If there has really been escape velocity, then the 10yr is still looking up from there, rather than fearing a lurch back.

There are risks to this in the guise of Europe and risk assets

So what are the risks? There are many, in fact.

The first is the juxtaposition between the US clamber to exit from the threat of negative rates to the eurozone's seeming reluctance to cast off those very same shackles. The ECB's soundings have been more along the lines of viewing the rise in yields (which has turned into a global thing, in fact) as detrimental to the recovery rather than as a sign of one.

In that sense, there are two risks. One is that eurozone yields remain a drag for US yields, so that, say, a 200bp Treasury - Bund spread presents a ceiling for the US 10yr. The other is that the rise in US rates is so abrupt that it does, in fact, result in self-harming, negating the benefits of escape velocity as the economy and yields flop back down again.

Should the Federal Reserve start to contemplate a taper of bond purchases, the experience in 2013 shows that risk assets can get very unnerved by it.

The third risk links this to the prognosis for equities and credit spreads. So far, so-called risk assets have held up fine. In fact, equities hit new highs in places. The trouble in fixed income is all about the rise in core rates, as credit spreads have been contained. But, this space is littered with risk,

especially if inflation and market rates continue to rise. That combination leaves corporates with higher re-funding costs and discounts future earnings more deeply, pushing up price/earnings ratios.

A tapering discussion from the Fed could be as good a catalyst as any for a risk asset underperformance, perhaps a severe one. And it would act to curb the upside to bond yields as cash would then flow back to the relative "safety" of bonds. [This could happen as early as the summer.](#)

Until then, it looks and feels like market rates will continue to test higher. From the Fed's view, this is tolerable as it discounts a success for them, as they are seen to be successfully generating reflation. The eurozone views it through a different prism, almost as a threat to the recovery, perhaps for good reason as they have been burnt many times before.

We'd like to think this is the real deal. It certainly feels like escape velocity in the US, and might just be enough to put some tempered optimism into the eurozone too. The holy grail of a positive 10-year swap rate is here, far sooner than we'd expected. Better not to get sucked back down to the depths of the inverted upside-down world of negative rates.

FX: Dollar bounce underwhelms

If, at the start of the year, we had been told that US bonds would sell off 50bp at a time that Europe's slow vaccine rollout had meant lockdown...

Source: Shutterstock

Dollar bounce underwhelms

The dollar should have done much better in the first two months of the year. This should have been the quarter when the dollar advanced either on: a) the far superior vaccine rollout in the US relative to continental Europe or b) a dramatic, (verging on the disorderly) rise in US bond yields which necessitated a re-pricing of risk assets.

In the G10 space, true, the dollar is 3% higher against the most defensive low-yielders of the Japanese yen and the Swiss franc. Yet many of the commodity currencies are still up 1-2% against the dollar since the start of the year. The fact that EUR/USD has 'only' dropped 1% year-to-date we read as the euro being traded as a cyclical currency and one that should benefit when 2Q21 provides broader indications of a synchronised recovery – which we still expect to be the case.

In other words, the recovery is a conviction trade.

Also denting the dollar's credentials may be the sense that the US is racking up more debt to be spent on consumption. This has implications for the trade deficit as well as a desire from Washington to keep the dollar soft, such that trading partners are not taking advantage of US consumption with under-valued currencies.

The Fed plays its part here by keeping real rates as negative as possible for the parts of the yield

over which it has control.

FX takes a back seat to bonds

Over the last month, FX markets have certainly played second fiddle to bonds – so much so that the European Central Bank is closely monitoring events in the bond markets rather than in FX. We are still of the view, however, that a broadening recovery in 2Q can push EUR/USD to the 1.25 level – where the ECB's verbal intervention will presumably power up again.

In our [Timing the Tantrum cross-market piece](#), we also highlighted how the FX market might perform if the Treasury sell-off escalated into a full-scale tantrum similar to the one seen in 2013.

There have been instances where a repeat of the 2013 sell-off has started to reappear – especially in high yield emerging market FX such as the South African rand as Turkish lira. However, EM economies have more stable external positions than those seen in 2013 and we would not expect to see a repeat of the 15-20% adjustment suffered by the most vulnerable countries back then.

Instead, we think position-adjustment would play a greater role today, with those most exposed to a further Treasury sell-off such as the heavily-backed Czech koruna in Europe, or the Korean won in Asia – the latter being exposed to equity outflows.

Yet our base case is that the recovery/reflation trade dominates in 2021, such that any corrective dip in currencies exposed to the global business cycle (including the EUR) proves short-lived and 5-8% rallies are achievable by year-end.

Source: Shutterstock

An army doctor prepares to inject the Sinovac vaccine from China during a vaccination at Fort Bonifacio, Metro Manila, Philippines

A different appetite for Covid-19 and a lack of vaccines is a bad mix

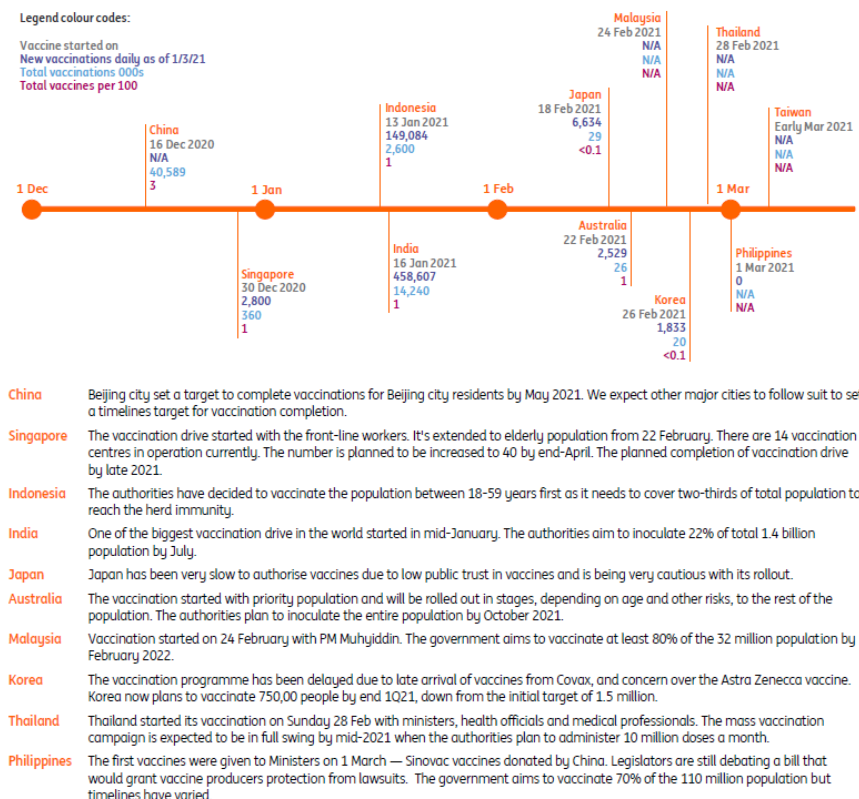

With many times the daily confirmed cases of the Philippines', the UK is mulling a slow reopening plan for its economy. In contrast, in metro-Manila, the unwinding of the lockdown has been pushed out once again, meaning that it will have lasted a full year by the middle of this month.

The Philippines may be an extreme example of Asian governments' reactions to Covid-19, but it is not totally out of line with the rest of the region. Singapore, for example, which has averaged less than one community case a day in recent weeks, has said that it is not about to move out of phase three restrictions any time soon, at least until more widespread vaccinations have been rolled out across the population, their effectiveness has been proved, and the rest of the world has Covid-19 under control.

With much of the region taking a similarly cautious approach and resting the case for any reopening on the vaccine rollout, this has highlighted a glaring problem. That is that Asia has, for the most part, been extremely slow to roll out its vaccination programme.

Even compared to the dithering and mismanagement evident in Continental Europe, Asia is lagging globally. Japan, for example, had, as of 1 March, vaccinated fewer than 30,000 of its population. For comparison, the latest United Kingdom figures showed a daily vaccination total of 530,000 the day before.

Vaccine rollout

Source: ING

Why the delay?

There are several reasons why Asia is lagging behind the rest of the world in vaccinating its populations. Here are our top four:

- **Queue jumping by others**

There has, without much doubt, been a degree of queue jumping by some countries. Those at the very front of the queues argue to have taken a risk in paying up for vaccines before they were even proven. This gamble seems to have paid off, with countries like the UK, UAE and Israel getting access to the vaccines they paid up for in advance, especially as many of them achieved successful phase three trials and received accelerated regulatory approval by local medical bodies.

- **Lack of locally produced vaccines**

The US and UK also benefited from having substantial vaccine production facilities within their

countries which surely helps. But so do India and China, yet they are still falling behind (though India is having a fairly decent go at rolling out vaccines to their population). With billion-plus populations, their goal is admittedly a more challenging one than for most European countries. Europe too has extensive vaccine production facilities on-site, so there is a limit to how much weight we can put on this excuse. We have to look elsewhere for the causes of failure.

- **Widespread vaccine mistrust/anxiety**

Population mistrust of vaccines is arguably a bigger problem in Asia than in some other parts of the world. Japan has endured a fraught history of alleged and real adverse reactions to various vaccines over the years, including the combined MMR vaccine. And the government has variously supported the vaccines' safety before withdrawing them and then re-introducing them. Not surprisingly, faith in government advice on vaccines is very low, with people more prepared to get their advice from friends and the internet. In the Philippines, Sanofi's Denvaxia vaccine for Dengue fever, a mosquito-borne killer in the tropics, was approved and then subsequently linked to the deaths of children and subsequently withdrawn. That vaccine had been in the works for 20 years. Understandably, there may be anxiety about vaccines that have been cooked up in less than a year combined with a lack of trust in government advice.

- **Legal framework for litigation of side-effects**

The vulnerability of vaccine makers to class action lawsuits in the event of real or alleged serious side-effects means that not only have the medical regulatory bodies been languid to provide their approval for vaccines, but the developers have also been in no rush to deliver physical vaccines to a region with relatively low Covid-prevalence, matched with an equally low appetite for vaccine risk. In some countries, the rollout has been delayed while legislation is passed to protect the vaccine companies from litigation in problems.

Central banks to sit on their hands all year

With Asia's economies likely to remain at least partially restricted for much of the year, the outlook for monetary policy in the region remains mostly one of inaction.

At one end of the spectrum, the normally hawkish Bank of Korea (BoK) may be one of the first central banks in the region to start unwinding emergency accommodation, with background concerns over house price growth and household debt accumulation the main reasons for normalisation. But the BoK will be very unlikely to make any move towards tightening policy until next year at the earliest. Despite potentially viewing a repricing of Korean Treasury Bond yields as a reasonable market response that could help rebalance the economy, they did intervene recently to try to stem the rise in local government bond yields, suggesting that on balance, they would prefer any such adjustment to be very gradual indeed.

Unsurprisingly, given recent market gyrations, no central bank in Asia looks like wanting to be either the first in the region to normalise or to steal a march on the US Fed

The same economic imbalance criticisms could also be levelled at a central bank at the

opposite end of the hawk-dove spectrum, the Reserve Bank of Australia (RBA). Yet they have committed to no tightening until 2024 at the earliest - which looks like a fairly obvious attempt to sound no more hawkish and probably a little bit more dovish than the US Federal Reserve. The RBA has been hard at work fighting the recent bond sell-off by upping their pace of general bond purchases under their QE scheme and driving their target 3-year bond yield back below its 0.1% target.

Bank Indonesia recently cut rates, so they are in no sense likely to reverse their policy stance any time soon. That said, Governor Perry Warjiyo has been hinting lately that despite ongoing problems tackling Covid-19 in Indonesia and extended movement restrictions, this is it as far as rate cuts go. Bank Negara Malaysia is also probably done with easing now that inflation has troughed and will likely return to positive territory in the coming months. But they won't be in a hurry to hike rates while Malaysia struggles more than most in the region with the pandemic. The tepid macroeconomy of Thailand and insipid Philippine recovery should also keep both the Bank of Thailand (BoT) and Bangko Sentral ng Pilipinas (BSP) inactive this year too.

Singapore's neutral nominal effective exchange rate index target will also almost certainly be left alone at the MAS April meeting. And the Bank of Japan (BoJ) will most likely resort to its usual playbook of talking about the potential for actions to stem unwelcome market moves but actually doing almost nothing of any substance. BoJ Governor Haruhiko Kuroda, as recently as January, seemed to suggest allowing benchmark Japanese Government Bond (JGB) yields to fluctuate in a wider band. However, there doesn't seem much appetite for that right now.

Unsurprisingly, given recent market gyrations, no central bank in Asia looks like wanting to be either the first in the region to normalise or to steal a march on the US Fed.

Eurozone: The underachiever

The sluggish pace of the vaccination campaign continues to jeopardise the eurozone recovery, though stronger manufacturing and construction activity are...

Source: Shutterstock

An elderly lady leaves after receiving a pfizer vaccine during a COVID-19 vaccination campaign in Pamplona, northern Spain

Sluggish vaccination campaign

At the risk of sounding like doomsdayers, we unfortunately have to repeat that the sluggish pace of vaccination continues to jeopardise the recovery in the eurozone. At the end of February, less than 5% of the population in the eurozone had received at least one dose of one of the vaccines. With Johnson & Johnson most probably able to step into the game from April onwards, supply constraints will ease, but the vaccination process also needs an urgent makeover in many countries if herd immunity is to be reached over the course of this year. This also explains why most eurozone countries have already announced that they will keep lockdown measures in place at least until the second half of March and probably even longer.

Industry and construction save the day

That said, eurozone companies are getting better at coping with the lockdown measures. While services are still heavily affected by the restrictions, both construction and industry are increasingly compensating for this. On the back of swelling order books, helped by the recovery in the rest of the world, confidence in industry rose in February to the highest level since May 2019.

And while the first quarter is still likely to show a small contraction, a gradual reopening of the economy from the second quarter onwards should allow a recovery to take hold. Vaccinations probably won't be advanced enough to see a normal tourism season this year, but we still think the eurozone should manage to grow by 3.8% in 2021, followed by 3.5% in 2022 on the back of some decline in the savings ratio. Bear in mind that even then, the pre-crisis GDP level will only be reached by the end of 2022, about one year later than in the US.

Stronger industry & construction, weak services

Source: Refinitiv Datastream

Inflation to top 2%

Meanwhile, inflation remained at 0.9% in February, with core inflation at 1.1%. Because of base effects in energy prices, combined with likely price increases in the services that reopen and the full swing of the German VAT reversal unfolding from July onwards, we now expect inflation to top 2% over the summer months. Though most of these effects will disappear in 2022 and for the time being there's little reason to expect a wage-inflation spiral, underlying inflation might remain slightly above 1% beyond 2021. We expect an above consensus 1.8% inflation rate this year and 1.5% in 2022 (compared with an average inflation of 1.0% in 2016-2020). In other words, a little upward drift that the ECB is likely to welcome, but still at the low end of the ECB's inflation objective.

Oil prices will push inflation higher

Source: Refinitiv Datastream

Yield curve steepening

Through different speeches, the ECB has given some colour on what it is looking at in order to maintain favourable financing conditions - though some might call it too colourful to fully distil the ECB's reaction function. In our view, the GDP-weighted sovereign bond yield curve could be a key element in determining overall financing conditions. However, it would not be easy for the ECB to actually reshape this yield curve. For ECB Executive Board member Isabel Schnabel it is clear that "a rise in real long-term rates at the early stages of the recovery, even if reflecting improved growth prospects, may withdraw vital policy support too early and too abruptly given the still fragile state of the economy. Policy will then have to step up its level of support". In other words, the ECB will continue to lean against the US-induced upward push in bond yields, through its Pandemic Emergency Purchase Programme. That said, we continue to expect the recovery to lead to some curve steepening, with the German 10yr bond yield likely to leave negative territory by the first quarter of 2022.

Source: Shutterstock

A girl runs through the daffodils in bloom in St James's Park in central London, 26 February 2021

Fast vaccinations and tumbling cases bode well for spring

UK bonds were front-and-centre in the recent reflation-driven sell-off, with gilt yields rising 50 basis points through February. Some of this is undoubtedly down to a reappraisal of growth prospects after a lacklustre post-Brexit period of activity. But it still poses an interesting question - is the UK really set to follow the US with surging inflation, or does it sit more closely with a more benign eurozone story?

When it comes to vaccines at least, the UK remains at the front of the pack. The government has hinted that the rate of inoculations will double over coming weeks, leaving open the possibility of all adults receiving both doses of a vaccine by early in the third quarter.

Combined with the relentless downtrend in case numbers (daily figures have fallen by roughly 90% on the January peak), there's no reason to doubt the UK's planned reopening through April and May, which will see the bulk of sectors reopen. The government hopes to remove the majority of restrictions on social gatherings by mid-June, though the risk is this is pushed back given concerns about new variants.

UK Covid-19 cases are down 90% on the January peak

6% second quarter growth means the BoE won't be in a rush to add more stimulus

It's likely that the reopening will drive 6% growth in GDP through the second quarter, and we think the economy may only be down around 2-3% on pre-Covid levels by year-end. However we should stress the picture has been heavily skewed by the inclusion of the government's Test-and-Trace spending, which on its own saw the level of monthly GDP revised up by around 1-1.5% by the end of 2020. This infrastructure is likely to remain necessary for some time, given the need for accurate intelligence on how the virus is spreading into next winter.

Still, the prospect of a decent spring recovery means the Bank of England has taken a fairly relaxed stance on the rise in yields so far. We also find it hard to see negative rates being enacted later this year assuming the outlook plays out as hoped.

We don't expect the US inflation story to be replicated in the UK

That said, where the UK story differs to the US is on inflation. Much of this comes down to fiscal support, which has arguably seen a greater boost for lower-earners across the Atlantic. While UK savings have risen sharply through the pandemic, lower-income groups have seen the opposite according to surveys - no doubt because the hardest-hit sectors tend to have the lowest wages.

While there is likely to be some pent-up demand, it may not have such a lasting impact on UK inflation.

Indeed, we expect to see a further rise in unemployment over coming months as the furlough scheme is unwound, but also as new Brexit-related costs put pressure on jobs. Consumer confidence surveys aren't yet consistent with households spending all of their newly-accrued savings.

So while there is likely to be some pent-up demand, undoubtedly driving up prices for certain supply-constrained services, it may not have such a lasting impact on UK inflation. Unlike the US, we also haven't seen so much supply erosion. Business closures in the hospitality sector haven't risen above 2.5%, and are heavily concentrated in the smallest businesses, according to ONS

surveys.

That may help explain why services inflation hasn't actually slowed that much during the pandemic, outside of restaurants/hotels etc which benefited from a VAT cut. Over time, services prices tend to be much stickier relative to goods in the UK.

In short, we do expect inflation to reach the 2% target in the fourth quarter, helped mainly by energy, but also some demand/supply imbalances and higher shipping costs. But we think these price pressures will dissipate a little in 2022, reducing pressure on the Bank of England to shift abruptly towards tightening policy.

Commodity supercycle calls grow

It has been an exceptional month for commodity markets, with growing inflation expectations increasing investor interest in the complex. Meanwhile,...

Source: Shutterstock

Oil pump jacks work in unison, Williston, USA

Investors flock to commodities

The commodities complex has had its best start to the year since at least 2008, with the Bloomberg commodities index finishing February more than 9% up since the start of the year, whilst recently the index had been up as much as 12% YTD.

We have continued to see increased investor interest in commodities with the expectation that as we see a global recovery from Covid-19 it will be bullish for commodity demand. In addition, given the loose monetary policy we have seen, coupled with fiscal stimulus, inflation expectations have only grown in recent months, which has increased the attractiveness of commodities for investors, given they are seen as an inflation hedge. Meanwhile, the broader weakness that we have seen in the US dollar for much of the last year has only provided further support.

All parts of the complex have seen a boost in speculative interest, including metals, agriculture and energy. If we look specifically at oil, the managed money net long position in ICE Brent stands at almost 350k lots, levels we last saw back in February 2020, and up around 292k lots from the lows seen in March last year. What is also interesting has been the fact that speculators have been increasing their spread positions in the oil market, and given that the forward curve has flipped from contango to a fairly deep backwardation, this shouldn't be too much of a surprise, given the

positive roll yield on offer.

However, if speculators are buying the oil market, there needs to be someone who is selling it, and positioning data shows pretty clearly that as we have seen the market rally, producers have been happy to hedge into this strength. The producer short position in ICE Brent is the largest we have seen since late 2019. For NYMEX WTI, the producer short has recently been at its highest level since 2017. It is pretty clear though, that this producer hedging in the oil market has provided little resistance to the market moving higher.

Are we entering a new commodities supercycle?

As commodities have rallied this year, more market participants have suggested that we are at the start of a new commodities supercycle. So, what exactly is a supercycle? It is an extended period of time where you see above-trend movements across large parts of the complex. A supercycle can last for decades, and the last one was back in the early 2000s, with rapid growth in China driving strong demand for commodities. That cycle lasted basically from early 2000 all the way until around 2014.

The sizeable amount of fiscal stimulus, along with loose monetary policy that we have seen over the last year to help with the post Covid-19 recovery is certainly a supportive factor for commodities demand. This is already evident when looking at the strong post Covid-19 recovery from China. Sizeable stimulus in China has boosted infrastructure projects and as a result, demand for commodities. All across the complex, China has featured as a strong buyer, with record oil, iron ore, copper and certain agri imports in 2020. If we are to see the start of a new supercycle, this robust demand growth that we are seeing from China will have to be sustainable for several years. This is something that we are less likely to see. However, China can still be the catalyst, we will just need to see other economies coming through with stronger demand growth. Energy transition has the potential to provide this. Investment in renewable energy infrastructure would provide a significant boost to demand for commodities, although this would be more beneficial for metals than fossil fuels.

On the supply side, a lack of investment does mean that markets are left potentially quite tight further out, supporting the idea that we could be at the foothills of a supercycle. Although for oil, US shale may be a limiting factor for prices rallying too strongly. During the previous supercycle, US shale was still in its infancy, and so producers were unable to respond quickly to stronger prices. However, with the US shale industry now more mature, their response to higher prices should be quicker.

Overall, while there are a number of factors which suggest that we could be at the start of a supercycle, we still believe it is too early to call. We would need to see robust and sustainable demand growth in the years ahead.

Oil balance set to continue tightening

We came into 2021 with [a bullish view for the oil market](#), but clearly Saudi Arabia's additional supply cuts, US supply disruptions due to freezing cold conditions, growing demand hopes, rising inflation expectations and the broader USD weakness have meant that the market outlook is even more bullish than we had anticipated.

As a result, [we recently revised higher our oil forecasts](#), and now expect ICE Brent to average

US\$65/bbl over 2021. While we see limited further upside in the first half of this year, it is over the second half of this year where we see more upside, given the expectation of a stronger demand recovery over this period. The continued tightening in the oil balance means that we see Brent trading at US\$70/bbl by year-end.

Downside risks for oil

However, there are still clear downside risks. Firstly, while we are seeing the rollout of vaccines, there is the risk that we still see further waves of Covid-19, which would weigh on demand. Secondly, in the near term, higher prices could see some buyers hold back. In recent weeks, Chinese buying seems to have eased. Thirdly, a swift return of Iranian barrels could slow the market rebalancing process. However, for now we do not see a significant return of Iranian supply until later this year at the earliest. Finally, there is always a risk that OPEC+ fails to agree on the next steps with regards to production cuts at its meeting on 4 March.

Savings: the two-sided wildcard for growth

In the first lockdown, surging savings rates across the Western hemisphere were mainly the result of involuntary savings. As a result, the reopening of...

Source: Shutterstock

The savings-consumption rotation during the first lockdown

The first lockdown saw an unprecedented surge in savings in the US and Europe. 'Involuntary savings' was the buzz phrase of the moment. With people suddenly sitting at home, retail stores, restaurants, bars and cultural events all closed, savings rates increased significantly. Planned vacations had to be cancelled, also adding to the increase in savings. The fact that these savings were mainly involuntary is also reflected in the relatively muted fall in consumers' willingness to spend. With the reopening of economies, savings dropped and consumption surged. In fact, the flow of savings equalled the flow of consumption almost entirely in the second and third quarters.

Did you save more or less?

Source: ING International Survey

In the eurozone, short-time work schemes helped support household incomes. Unemployment rates remained relatively stable and the fear of potential job losses was high but short-lived. Savings rates across the eurozone surged on the back of involuntary and precautionary savings. According to European Commission surveys, the assessment of households' own financial situation worsened but only to historic averages and not below. Interestingly, the intention to save did not drop again in the third quarter, while excess savings were reduced and private consumption surged. The countries hit most by the crisis saw only half of these excess savings in 3Q actually spent in that quarter. In all countries, the savings rate remained higher than before the start of the crisis. This suggests that a larger part of the population increased savings as a precaution and not simply due to the lack of spending opportunities.

In the US, the story is slightly different. Rather than adopt the European style furlough schemes which were designed to preserve jobs, the US government took the decision to avoid interfering directly in the labour market. Instead, they chose to strengthen the financial safety net for those who lost their jobs by extending the duration of unemployment benefits, expanding the number of people who could receive them and then initiating a new \$600 weekly Federal unemployment benefit to boost incomes. In consequence, the University of Chicago calculated that 69% of unemployment benefit recipients actually earned more money being unemployed than when they were working. The median recipient received 134% of their previous after-tax compensation.

This has promoted a broad strengthening of the US household balance sheet with cash, checking and savings deposits increasing by \$2 trillion between 4Q 2019 and 3Q 2020 while outstanding credit card balances have fallen to a four-year low. Given the upscaled and expanded unemployment benefits and the \$1200 CARES Act stimulus payment, increases in US savings are likely to have been spread more broadly across the income spectrum versus Europe. ING's own international savings survey backs this up based on responses to who has increased savings rather than run them down.

Factors that have boosted US household incomes each month (annualised change in income versus February 2020 - USD tn)

The savings-consumption rotation during the second lockdown

Savings increased again during the second lockdown but in the eurozone, the willingness to spend has weakened, falling to the lowest level since June. This drop masks significant changes between what are basically two groups; the countries which entered a second lockdown in November like France or Belgium and the countries which entered a strict lockdown only at the end of 2020, like Germany. The former have seen a very subdued willingness to spend since the initial spike after the reopening, while the latter saw the hit to consumer confidence only recently. Overall, the willingness to spend remains low, which argues against a sharp surge in consumption once economies reopen. In fact, it looks as if involuntary savings have been replaced by precautionary savings. At the same time, however, don't forget that a reopening will boost demand for services like hospitality, leisure and culture as well, something that is not fully captured by traditional surveys.

It is also worth noting that consumption has not collapsed as much as it did during the first lockdown as both retail stores and customers have been able to adapt to new circumstances, shifting towards online shopping, and fewer planned expenditures had to be cancelled. Therefore, with the more subdued downswing, an accentuated rebound looks less likely.

Unlike Europe, the US did not enter a full second lockdown with the most onerous restrictions experienced only by Californians. Now that California's stay at home order has been rescinded and New York and other cities are again open for eat-in dining there is more opportunity to spend.

Recent data has shown that the improved financial position of US households means that when presented with a windfall payment, such as the latest \$600 stimulus cheque, consumers have the confidence to spend it. This contributed to a 5% month-on-month jump in retail sales in January with daily credit and debit card transaction data from www.tracktherecovery.org indicating that the bulk of the additional spending came from lower income households.

This is an encouraging precedent for the outlook for consumer spending since President Biden is proposing to raise the extra Federal weekly unemployment benefit back to \$400 per week after it

was tapered in 2H20 while also providing an extra \$1400 individual stimulus payment. He also has aspirations to raise the minimum wage to \$15/hour nationally, which if implemented would further boost the earning power of lower income households.

With the US Covid vaccination programme gaining momentum, there is a realistic chance of a broad economic reopening in mid to late 2Q 2020, including for consumer services, leisure and hospitality. This is potentially one to two quarters ahead of Europe. US job opportunities will therefore improve more swiftly, with surveys already suggesting that households expect jobs to become more plentiful, which could boost the chances that households use some of their accrued savings for spending over coming months. Significantly, the unemployed also have the guarantee of robust unemployment benefits to fall back on should they fail to find work.

Outlook: Pent-up demand or too elevated expectations?

Looking ahead, the key question for the economic outlook is whether the great rotation between savings and consumption in 2Q and 3Q will repeat itself or whether the latest increase in savings will be left unspent. The US and eurozone patterns differ significantly mainly due to two factors: the distribution of savings across different income categories and the sheer size of the income subsidies.

An important determinant of potential consumption is the distribution of excess savings across the different income groups. In theory, the propensity to spend is lower in high-income households than in low-income households. Against this background, the results of an ING survey give interesting insights. While in the eurozone between 30% and 40% of the higher-income households saw their savings increase during the pandemic, only around 20% of the lower-income households reported higher savings. In the US, these numbers are much more dispersed across the entire income range.

Changes in savings behaviour according to income

Source: ING International Survey

The size of the direct income subsidies has also been much larger in the US than in the eurozone. While in the eurozone even short-time work schemes mean at least a small drop in disposable income, the fact is that at least initially almost 70% of US unemployment benefit recipients earned more money due to the government support than when they were working. Additional payments of \$1200 and \$600 (with a third proposed payment of \$1400) helped further improve the financial position of millions of households.

Fiscal stimulus more targeted to the lower-income US households should lead to a stronger

boost of private consumption than the more indirect stimulus in the eurozone. Also, the second lockdown seems to have anchored fears of potential job losses in the eurozone, shifting involuntary savings to precautionary savings. This is not something we have seen in the US.

OPEC+ surprises the market again

OPEC+ is making a habit of surprising the market these days, with the group deciding it would keep output levels largely unchanged for April. Only Russia...

Source: Shutterstock

Very limited OPEC+ easing

In the lead up to Thursday's meeting there was plenty of uncertainty around what OPEC+ might do, particularly given the strength that we have seen in the market so far this year, with Brent up more than 28% YTD.

The group at the start of the year held off from easing output cuts, whilst we also saw Saudi Arabia surprise the market back then with an additional 1MMbbls/d of voluntary cuts for February and March. So, heading into Thursday's meeting, expectations were that we would at least see Saudi Arabia end its voluntary cut, however the Kingdom has decided that it will continue to hold off this supply from the market through the month of April as well.

Meanwhile, the stronger price environment led to the expectation that there would be pressure from within the group to start easing, particularly from the likes of Russia. Expectations were that the group would ease cuts by 500Mbbls/d, however this has not happened. Instead only Russia and Kazakhstan will be increasing output, by 130Mbbls/d and 20Mbbls/d respectively. These were the only two members to ease over February and March as well, with the group using the excuse that it is due to "seasonal consumption patterns".

While OPEC+ clearly do see improving fundamentals for the oil market, they are still conscious of the fact that there is plenty of uncertainty around the demand outlook, and so do appear to be taking a more cautious approach.

There is also an element where OPEC+ do not believe that US oil production will be able to respond to the higher price environment, at least not any time soon. This was pretty clear with the Saudi energy minister commenting that “drill baby, drill is gone forever”. If this is the attitude that OPEC+ are taking it does suggest that they believe they can push prices even higher, without the risk of losing market share. Meanwhile, political pressure from the US will likely be less, with President Trump now out of office. Although saying that, there will likely be growing pressure from other key importers.

Tighter market, higher prices

Clearly due to the lack of easing, we will see a tighter than expected market in the coming months, which should send prices higher in the short term. However, with the group next set to meet on 1 April it is difficult to see how they could justify maintaining current output levels further into 2Q21. Pressure within the group will only grow to increase output in the current price environment. In addition to this, we will need to see how compliance holds up, with stronger prices increasing the temptation for some members to increase output. We expect that higher prices for the remainder of this month will push the group to start easing more aggressively from 1 May onwards. This should bring some stability to prices. However, as we have seen a couple times already this year, it is risky second guessing what OPEC+ may do.

Given the latest decision from OPEC+, we have revised higher our oil price forecasts, and would not be surprised to see Brent testing US\$70/bbl ahead of the next OPEC+ meeting. Assuming they decide to start easing then, it should bring some stability to the market. We see Brent averaging US\$67/bbl over 2Q21, and US\$70/bbl over 2H21. A stronger demand recovery over 2H21 should continue offering support to prices, as OPEC+ eases. Meanwhile, for 2022 we have made only minor changes, with stronger prices now suggesting that we could see further upside in US output next year.

ING oil price forecast

Current	1Q21	2Q21	3Q21	4Q21	1Q22	2Q22	3Q22	4Q22
ICE Brent (US\$/bbl)	62	67	70	70	68	70	73	70
NYMEX WTI (US\$/bbl)	59	64	67	67	65	67	70	67
Previous	1Q21	2Q21	3Q21	4Q21	1Q22	2Q22	3Q22	4Q22
ICE Brent (US\$/bbl)	60	63	66	69	65	70	73	70
NYMEX WTI (US\$/bbl)	58	61	64	67	62	67	70	67

Knocking on US shale's door

Taking the view that the US shale industry will not bounce back is a brave one. If we have learnt anything in recent years, it has been how resilient the US oil industry can be.

In the short term, clearly the US industry will struggle to respond to these higher prices. However, come 2022 there is the potential for further production growth from the US. The US oil rig count has trended higher for the last 5 months or so, and with prices set to remain well supported, we

would expect to see the level of drilling activity to only pick up in the months ahead. This does suggest further upside to US oil output next year. At the moment, the EIA is forecasting that US oil production will grow by around 500Mbbls/d YoY, while there are some forecasts for even stronger US output growth going into 2022, and these will only grow if we continue to see further price strength through this year. If we look at the WTI forward curve, it is basically trading above US\$55/bbl through until the end of 2022, while the entire forward curve is above US\$50/bbl.

FCA finally announces Libor transition end date

The UK regulator has officially announced the date at which Libors will cease to be representative - a milestone in the transition

Source: Shutterstock
Financial Conduct Authority (FCA)

There it is in black and white.

The Financial Conduct Authority has made the much-awaited [pre-cessation announcement](#).

In addition to the confirmation that most Libors, the so-called London Interbank Offered Rate will cease to be representative on 31 December (except one, three, six months USD Libor), the FCA also detailed plans for the production of synthetic Libor replacement after these dates in a limited number of cases.

A rocket on transition efforts

The ramifications are manifold, as discussed in our [latest libor transition report published last month](#).

Chief among them, the announcement fixes the spread calculation in fallback rates. This is relevant for many contracts that include a pre-cession trigger for this spread calculation, notably for derivatives counterparties having signed up to the ISDA's and ISDA trades conducted after January 25 2021.

As ISDA, the financial derivatives industry body said, "it will likely put a rocket on transition efforts".

China: What a super low “above 6%” GDP growth target means?

China unexpectedly set a GDP growth target, but at a relatively low level compared to the consensus forecasts and our forecast. What does this mean for...

Worry and questions from the very low GDP target

The very low GDP growth target seems like there is no target at all because the consensus is 8% and our forecast is 7%.

But when we look at this with other numbers, e.g. the fiscal deficit at 3.2% of GDP - the government explains that the main use of this money will be for job stability - then I am worried that the low GDP target could signal a possibility that the government includes a scenario for the comeback of Covid.

Summary of figures announced in the government work report 2021

- GDP growth target: above 6% vs no target set for 2020
- Fiscal deficit: 3.2 % of GDP vs 3.6% in 2020 with the objective to ensure job stability, and will issue special local government bonds of CNY3.65 trillion for infrastructure like water management, renewable energies.

- Surveyed jobless rate in urban areas: 5.5%, add 11 million jobs in urban areas
- CPI: around 3%
- Current account: almost balanced
- Technology advancement: tax reduction and increase government technology R&D expense by 10.6%, set milestone targets to be achieved by 2030
- Reforms: anti-monopoly with special mention on fintech; cut energy consumption per GDP by around 3% through reducing pollution emissions

Technology is the focus

If I worry too much and Covid in fact does not make a comeback in China then most of the fiscal money will be used to advance technology.

Technology R&D is the focus. The government report brings back the concept of [Technology Innovation 2030](#), which means the government has a roadmap for its technological advancement, but the 2030 targets were set several years back (2017-2018) so there should be some revisions to the 2030 technology targets as following the old plan won't beat the world's most advanced technology.

Green is a commitment

The target is to cut energy consumption per GDP by around 3% by reducing pollution emissions, and 70% of heating in the northern region will come from clean energy. This should be a start to commit to the net-zero carbon emission target by 2060.

Overall comment

Wording on the fiscal and monetary policies is the same as last year. The PBoC, China's central bank, will continue to stay put in 2021, even as this is a year for deleveraging. And the fiscal spending we discuss above shows that money can be used on Covid if there is a comeback or else it can be used on technology R&D.

There is in fact not much surprise from the government work report except for the super-low GDP target. This makes me feel uneasy as I don't know what exactly the government wants to tell us about the recovery path it expects.
