

## A greater depression?

With the COVID-19 pandemic still spiraling out of control, the best economic outcome that anyone can hope for is a recession deeper than that following the 2008 financial crisis. But given the flailing policy response so far, the chances of a far worse outcome are increasing by the day, **writes Nouriel Roubini**

Nouriel Roubini

### Unprecedented free fall

The shock to the global economy from COVID-19 has been both faster and more severe than the 2008 global financial crisis (GFC) and even the Great Depression. In those two previous episodes, stock markets collapsed by 50% or more, credit markets froze up, massive bankruptcies followed, unemployment rates soared above 10%, and GDP contracted at an annualized rate of 10% or more. But all of this took around three years to play out. In the current crisis, similarly dire macroeconomic and financial outcomes have materialized in three weeks.

Earlier this month, it took just 15 days for the US stock market to plummet into bear territory (a 20% decline from its peak) – the fastest such decline ever. Now, markets are down 35%, credit markets have seized up, and credit spreads (like those for junk bonds) have spiked to 2008 levels. Even mainstream financial firms such as Goldman Sachs, JP Morgan and Morgan

Stanley expect US GDP to fall by an annualized rate of 6% in the first quarter, and by 24% to 30% in the second. US Treasury Secretary Steve Mnuchin has warned that the unemployment rate could skyrocket to above 20% (twice the peak level during the GFC).

In other words, every component of aggregate demand – consumption, capital spending, exports – is in unprecedented free fall. While most self-serving commentators have been anticipating a V-shaped downturn – with output falling sharply for one quarter and then rapidly recovering the next – it should now be clear that the COVID-19 crisis is something else entirely. The contraction that is now underway looks to be neither V- nor U- nor L-shaped (a sharp downturn followed by stagnation). Rather, it looks like an I: a vertical line representing financial markets and the real economy plummeting.

## Preventing a private sector collapse

Not even during the Great Depression and World War II did the bulk of economic activity literally shut down, as it has in China, the United States, and Europe today. The best-case scenario would be a downturn that is more severe than the GFC (in terms of reduced cumulative global output) but shorter-lived, allowing for a return to positive growth by the fourth quarter of this year. In that case, markets would start to recover when the light at the end of the tunnel appears.

But the best-case scenario assumes several conditions. First, the US, Europe, and other heavily affected economies would need to roll out widespread COVID-19 testing, tracing, and treatment measures, enforced quarantines, and a full-scale lockdown of the type that China has implemented. And, because it could take 18 months for a vaccine to be developed and produced at scale, antivirals and other therapeutics will need to be deployed on a massive scale.

---

### *Governments need to deploy massive fiscal stimulus*

---

Second, monetary policymakers – who have already done in less than a month what took them three years to do after the GFC – must continue to throw the kitchen sink of unconventional measures at the crisis. That means zero or negative interest rates; enhanced forward guidance; quantitative easing; and credit easing (the purchase of private assets) to backstop banks, non-banks, money market funds, and even large corporations (commercial paper and corporate bond facilities). The US Federal Reserve has expanded its cross-border swap lines to address the massive dollar liquidity shortage in global markets, but we now need more facilities to encourage banks to lend to illiquid but still-solvent small and medium-size enterprises.

Third, governments need to deploy massive fiscal stimulus, including through “helicopter drops” of direct cash disbursements to households. Given the size of the economic shock, fiscal deficits in advanced economies will need to increase from 2-3% of GDP to around 10% or more. Only central governments have balance sheets large and strong enough to prevent the private sector’s collapse.

## Risk of a new Great Depression

But these deficit-financed interventions must be fully monetized. If they are financed through standard government debt, interest rates would rise sharply, and the recovery would be

smothered in its cradle. Given the circumstances, interventions long proposed by leftists of the Modern Monetary Theory school, including helicopter drops, have become mainstream.

---

*Unless the pandemic is stopped, economies and markets around the world will continue their free fall*

---

Unfortunately for the best-case scenario, the public-health response in advanced economies has fallen far short of what is needed to contain the pandemic, and the fiscal-policy package currently being debated is neither large nor rapid enough to create the conditions for a timely recovery. As such, the risk of a new Great Depression, worse than the original – a Greater Depression – is rising by the day.

Unless the pandemic is stopped, economies and markets around the world will continue their free fall. But even if the pandemic is more or less contained, overall growth still might not return by the end of 2020. After all, by then, another virus season is very likely to start with new mutations; therapeutic interventions that many are counting on may turn out to be less effective than hoped. So, economies will contract again and markets will crash again.

Moreover, the fiscal response could hit a wall if the monetization of massive deficits starts to produce high inflation, especially if a series of virus-related negative supply shocks reduces potential growth. And many countries simply cannot undertake such borrowing in their own currency. Who will bail out governments, corporations, banks, and households in emerging markets?

## Other global risk factors

In any case, even if the pandemic and the economic fallout were brought under control, the global economy could still be subject to a number of “white swan” tail risks. With the US presidential election approaching, the COVID-19 crisis will give way to renewed conflicts between the West and at least four revisionist powers: China, Russia, Iran, and North Korea, all of which are already using asymmetric cyberwarfare to undermine the US from within. The inevitable cyber attacks on the US election process may lead to a contested final result, with charges of “rigging” and the possibility of outright violence and civil disorder.

Similarly, as I have argued previously, markets are vastly underestimating the risk of a war between the US and Iran this year; the deterioration of Sino-American relations is accelerating as each side blames the other for the scale of the COVID-19 pandemic. The current crisis is likely to accelerate the ongoing balkanization and unraveling of the global economy in the months and years ahead.

This trifecta of risks – uncontained pandemics, insufficient economic-policy arsenals, and geopolitical white swans – will be enough to tip the global economy into persistent depression and a runaway financial-market meltdown. After the 2008 crash, a forceful (though delayed) response pulled the global economy back from the abyss. We may not be so lucky this time.
