

Market calm wavers

Yesterday's strong US employment data has nudged complacent markets out of their narrow range but will need verification from the official labour report due out of the US this Friday.

Source: Shutterstock

Asia's markets usually take their lead from global markets, but for the last few weeks, that direction has been almost undetectable. However, the global market background stayed slightly risk-off for a second day yesterday, with the NASDAQ share index down about a per cent (not so much the S&P500). The principal driver for this seems to have been a very solid ADP employment report. This came in at 978K - about the same number forecasters were anticipating for payrolls last month when it actually came in at 266K.

Some years ago, when I used to do the US economy job (which my colleague James Knightley has taken on and vastly improved!), I used to regard the ADP as a better, "cleaner" measure of what was actually going on in the labour market than payrolls itself. This is because the non-farm payrolls number is a) only a survey b) subject to some curious seasonal adjustments 3) subject to further weird adjustments such as the births/deaths model for firms and 4) affected by anomalous weather, such as hurricanes, heavy snow etc which means that the end result may differ markedly from what is actually going on in the real world. The ADP is still messed about a bit by statisticians, but it is the actual payrolls managing firm for about 70% of private sector employment in the US, and as such might more reasonably be regarded as the "real payrolls number".

So to my mind, we don't need to wait for payrolls, though the market still remains a very big fan of it.

The other market response to the ADP result was some higher bond yields. The 10Y US treasury yield is now back up above 1.6% at 1.625%, and this seems to be mainly a real yield effect based on expectations about stronger jobs than an inflation expectations effect, with the breakeven 10Y rate remaining at about 2.45%. But you shouldn't rule out more movement from the breakeven rate. The ISM services index yesterday showed the prices paid index up at a very frothy 80.6 - and that will be largely a wage cost indicator. Moreover, we had some intriguing unit labour cost figures which were also strongly higher over the quarter, which could also point in the direction of higher labour costs.

Not surprisingly with bond yields higher, we have seen some broad-based USD strength, with the EURUSD back down to 1.2130 and Asian FX pack mostly weaker against the USD. Can we rely on payrolls to validate the ADP hint and give markets a further push in this direction? Not at all. But it is the least worse indicator we have, so shows the balance of risks.

Prakash Sakpal writes this about today's Reserve Bank of India meeting. "The Reserve Bank of India's Monetary Policy Committee will unveil the outcome of the bi-monthly policy review today at 10 am local time. We share a solid consensus of no change to the policy. This means all the market interest will be in the policy statement for the central bank's thinking on evolving growth and inflation trends amidst the ongoing Covid-19 second wave. Inflation has been elevated in the upper half of the RBI's 2-6% policy target (4.3% YoY in April), whereas growth likely took a strong hit from the Covid-19 second wave and associated lockdowns around the country. As this leaves rate policy in limbo, unconventional easing is doing all the heavy lifting. Governor Shaktikanta Das emphasised this in his unscheduled address a month ago (5 May) and he is expected to do so again today. After a strong run from late April to May, the INR has returned to be Asia's underperformer in June. Our end-2Q USD/INR view is 73.00 (spot 72.90)".
