

US financial conditions are loosening, but the Fed is hiking. What gives?

Since April the Federal Reserve has hiked by 200bp, but over the same period financial conditions have improved, bringing them back to where they were in April. Why? Market rates have fallen and credit spreads have narrowed, especially since June. This must reverse. Else the Fed has no choice but to get tougher. Another reason for the US 10yr to re-test 3%

US financial conditions have loosened so much it looks like we're back to square one

Long before the Federal Reserve started to hike in March this year, US financial conditions had moved from being ultra-loose around the turn of the year to being reasonably tight just before that first hike. In effect the market was doing the tightening for the Fed ahead of their first hike.

Measured in terms of standards of deviations away from the mean, financial conditions moved from +1 (ultra loose) to -0.5 (reasonably tight). They then tightened more as market rates continued to rise, credit spreads tightened and the dollar strengthened. By end-June,

US financial conditions were at -1.5 (very tight). But since then, financial conditions have loosened. They are now at -0.2, which is only moderately tight (after months of official tightening)!

US financial conditions have in fact loosened in an impressive manner since early July, so much so that they're now back to where they were in February (and briefly again in April). But here's the thing. Since April the Fed has delivered 200bp in rate hikes, with the implied purpose of tightening financial conditions. We're not quite back to square one, but this looks quite odd all the same.

In a sense, the financial markets have undone the tightening down by the Federal Reserve since they started to get serious with out-sized hikes. Why? Two reasons (graphs below). 1. We've been generically risk-on in the past six weeks, with credit spreads well off their highs and still tightening, and 2. Market rates have fallen (from 3.5% in June, the US Treasury yield almost got to 2.5% before backing off). Given that the Fed wants financial conditions tighter (else why hike), this combination can't continue.

The loosening in financial conditions that needs to be reversed

Source: Macrobond, ING estimates

Expect financial conditions to re-tighten in the weeks and months ahead. After all that's what the Fed wants and needs

Between now and the 21st September FOMC meeting, and assuming no material change from the prognosis of easing but sticky underlying inflation, the Fed will be hoping that financial conditions re-tighten. That way they can ratify the tightening with a hike. Else the Fed will be left with the less comfortable position of coaxing tighter financial conditions, whether through the verbal or policy action route.

When the Federal Reserve hikes on 21st September (we think by 50bp), it will bring the effective funds rate to a level that is practically flat to where the US 10yr Treasury yield currently trades at today. From there things get interesting. In all probability the Fed needs to do more; we think they get to 3.5% to 3.75% by year end. As we noted in a previous piece ([here](#)), the 10yr yield can trade through the funds rate, but will only sail through it when the funds rate has actually peaked.

Specifically, the 10yr yield should not trade more than 50bp through the funds rate unless the funds rate has peaked. In fact typically it would tend to be no more than 25bp through pre the peak, and once the funds rate has peaked, then the 10yr can get as far as 150bp through. But the funds rate has not peaked as of yet, so the 25-50bp range through the funds rate is where the

extreme should be.

That also places upward pressure on market rates. Look for the US 10yr to head back above 3%, even on a slowdown

So, if the Fed is heading to 3.5% or higher, that must put upward pressure on the 10yr Treasury yield in the months ahead. We maintain our view that the US 10yr needs to get back to a 3% handle, and in fact it could hit 3.25% given the Fed ambition (our view of their ambition) to get the funds rate north of 3.5%.

The risk asset environment will have to re-calibrate too. Implicit in the notion of tighter credit spreads is a discount for a more tame financial environment and a reduction in recession, and by extension, default risk. The thing is if inflation does not fall fast enough the Fed will feel emboldened to continue to hike even as the economy creaks, re-heightening the recession / default risks that lie ahead. And further loosening in financial conditions places even more pressure on the Fed to act as an offset.

Better then for financial market to anticipate this, and move in a direction that re-tightens financial conditions. Apart from higher market rates, that also includes widening pressure on credit spreads. The signalling for that can come from a higher interest rates narrative; one that is deemed persistent till the job is done. The idea of a seemingly never ending sequence of hikes from the Fed and a ratcheting higher in market rates can be enough to dampen the enthusiasm in risk asset space.

We are attempting to thread a very tight needle here in the sense that we have also called the top for the US Treasury yield at 3.5% ([here](#)); the level hit in mid-June. The factors that drove that call remain in play, as the 5yr now has a persistent richness attached to it (classic turning point tendency) and inflation expectations have calmed and remain well down from where they were.

So the call remains that 3.5% was the peak. The fall in rates since then made sense. But the threat of the move below 2.5% was too far too fast. And we have since been calling for the 10yr to head back up to a 3% handle (and potentially extend to 3.25%).
